Atlanta — January 30, 2008 — Reverse logistics solution provider **MDSi** has acquired the assets and repair capabilities from **nFini Systems**, a repair organization that specializes in the repair of transmission/transport and central office equipment.

MDSi believes that its new suite of services and testing facility create immediate opportunities from a repair perspective and provide its client base the talent and expertise needed for expansion.

The acquisition adds nFini's test facility to MDSi's existing network of services, which includes the following capabilities: Tellabs 5500; Alcatel LS2000; AFC UMC 1000; DDM2000; Next Level USAM; Adtran; Nortel Ring Generators — 6X30CA and 5C05AC/AD; Rectifiers — Emerson, Argus, Lorain, Marconi, Valere, etc.; Carrier access (CAC); Telect; and Copper Mountain.

Additionally, these new services will help MDSi maximize its Think Green, Think MDSi initiative, its environmental protection program for the supply chain.

"Customer service and empowering our clients to better use the capital they have tied up in technology are our primary goals," said Bob Pike, president and chief operating officer for MDSi. "Our clients often find themselves squeezed between capital and operating expense pressures while, at the same time, being asked to deliver more network functionality and features. The acquisition better enables us to help our clients relieve these pressures. The repair and additional test capabilities lengthen the life of our client's assets. This helps drive greater return and frees up capital to drive more revenue from their assets, while contributing to a healthier planet."

"nFini's repair capabilities, coupled with MDSi's reverse logistics expertise, further cement the fact that MDSi offers the industry's best redeploy, repair, resale and recycle (4

R's) services available," said Shirley Pate, co-founder of nFini Systems. "We look forward to continuing our environmentally sound practices and excellent customer care under the MDSi name."
